

CASE STUDY

Tree removal from a sensitive location

The Project

For the convenience of the client and the local environment we very often get asked to work over the weekend, and of course as Tree Surgeons where emergencies are concerned, this is something we are well versed at doing. This particular project was on a busy bus lane, so it was crucial that work was carried out on a Sunday so as not to disrupt the bus route during busy periods.

Fortunately, the use of a chainsaw didn't disturb local residents because the location was in the main surrounded by commercial offices and retail establishments that were closed for the day.

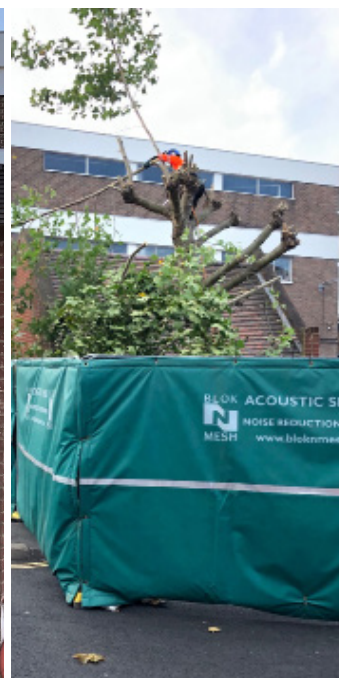

The Work

Our work was the removal of a very large tree from the new construction site. In order to gain access we needed to implement an element of road management to make sure the area was safe for motorists and pedestrians. Firstly, our team set about putting up barriers to reduce noise and provide a safety net for any passing traffic or pedestrians.

Once in place we were able to start work using a rope and harness to firstly remove the branches and then to sectionally dismantle the main trunk of the tree. The tree was dismantled to ground level ready for the area to be used for other purposes. Following completion we removed all debris and sections which were taken to be recycled elsewhere.

Conclusion

When you work in difficult locations, planning the removal of a tree is very important. Road safety, and removal of trees to prevent damage to local infrastructure is absolutely key to a successfully completed project.
